

ABSTRACT OF THE DISCLOSURE

Sub A2
The invention is directed to a method and system for conducting an on-line auction, in which the bidding is weighted to encourage early bidding, and higher bidding.

Each time a buyer places a new high bid on an item being offered at the auction, he is accorded a number of points, which is weighted to reflect the amount of the bid, either as an

5 absolute value or as a relative increase in the high bid compared to prior bids, or in some other fashion. The bid may also be weighted to reflect how long the bid stays the high bid. In this fashion, the bidder is encouraged to place a bid early so that he will have the high bid for as long as possible, and to outbid higher bids, so that he does not lose his position as the high bidder. The inventive system will therefore result in higher bidding, overall, for items offered 10 for sale in this system, and therefore yield a more fair and accurate test of the true worth of the item offered for sale.
